# 高齢者に優しい環境に関する国際共同研究 International study on age-friendly environment

[Background] Age-friendly environment was one of the 5 strategic priority areas identified in the global strategy and action plan on ageing and health 2016–2020.(WHO 2020). We participated in the International collaboration initiated by AIHD Mahidol to study age-Friendly Environments in ASEAN Plus Three: Case Studies from Japan, Malaysia, Myanmar, Vietnam, and Thailand University.

**(Objective)** To measure and compare community residents' perception of how age-friendly their environment and compare across the countries. To find out the influence of age-friendly environmental factors on quality of life, active ageing and social network diversity.

[Methods] WHO: Measuring the age-friendliness of cities (2015). 20 itemed WHO age-friendliness indicators was transculturally translated and piloted to be in Japanese version.

**(Findings)** Community residents in Japan receive a balance of care, welfare and health services. Regarding the factor significant for social network diversity, altogether 69.66% of the participants did not participate in a volunteer activity, 77.33% did not engage in paid employment and 51.30% did not have internet access at home. Regarding the factors significant for active ageing, 55.55% of the older people seemed unable to join a sociocultural activity at least once in the previous week, and 43.48% did not join group exercise activity in their leisure time. Regarding the factors significantly related to quality of life, 24.47% seemed to not have access to the local

source of information about health concerns and service; 30.71% did not get their needs of personal care and assistance at home using formal care services; and 39.3% who needed assistance did not have enough income to meet their basic needs over the previous 12 months.

**Conclusion** In conclusion, access to care is important for the quality of an older person's life whilst social participation and exercise promote active ageing.

#### 新型コロナ感染症流行による社会的インパクトに関する国際共同研究 2-(2) Multinational study of community response to COVID-19 pandemic

**Background** Whilst policy interventions were broadly similar across the globe, there were some differences in individual and community responses. This study explored community responses to COVID-19 containment measures in different countries and synthesized a model.

[Objective] This study explains the community response to pandemic containment measures in the local context, so as to be

suitably prepared for future interventions and research.

[Method] A multinational study was conducted from April-June 2020 involving researchers from 12 countries (Japan, Austria, U.S., Taiwan, India, Sudan, Indonesia, Malaysia, Philippines, Myanmar, Vietnam and Thailand). Steps in this research consisted of carrying out open-ended questionnaires, qualitative analyses in NVivo, and a multinational meeting to reflect, exchange, and validate results. Lastly, a community response model was synthesized from multinational experiences.

(Findings) Eight themes emerged: Communication strategy. Habit and behavior of the people, sustained essential social services to enable people to stay at home, economic back up to endure the tough time, preventing the clusters as a result of cultural norms, and festivals, alternative way to have fun or to work and practice social activities, public experience of pandemics, and privacy and human right of the patients, suspects and

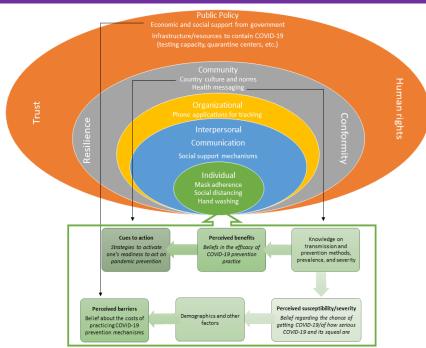

Figure: Community responses to covid-19 pandemic first wave containment measures: a model synthesized from multinational experiences in 2020.

everyone constitute community response to the pandemic and containment polices.

[Conclusion] Understanding community responses to containment policies will help in ending current and future pandemics in the world.

# <mark>2-(3)</mark> ミャンマー国およびタイ王国における糖尿病患者の運動栄養に関する研究 Study on physical activity, eating habit & T2DM in Myanmar & Thailand

[Background] Diabetes is a common NCD in Thailand and Myanmar. The prevalence of type 2 diabetes was 9.9% in Thailand and 10.5% in Myanmar in 2014. Thailand and Myanmar share long border and common cultures. Non-communicable diseases are linked to the culture. The culture of two countries are similar but the health system and health promotion activities are very different. The aim of the present study was to identify the risk factors of T2DM in Yangon Myanmar and Chiang Mai Thailand applying case-control studies in the community setting.

**(Objective)** To compare the physical activity level, dietary habit, social support, and salt and sugar level in the home-made food between newly diagnosed diabetes patients and controls.

[Methods] Case control studies. Cases are defined with eligibility criteria and compared with community controls to find our the different in association with interested exposure variable. International physical activity questionnaires (IPAQ-short) version, combined food habit questionnaires, ENRICH social support questionaries were used. Atago Digital salt-meter ES-421 and Atago Pocket saccharimeter PAL-J were applied for salt and sugar contents in the home-made dishes.

**(Findings)** There publications has been published to report the finding in Myanmar such as low physical activity and age older than 40 are the risk factors of diabetes. More analysis and publications are coming soon.

**Conclusion** The finding from these study aims to assist public health authorities to assemble the preventative intervention for diabetes in each county and culturally similar countries.

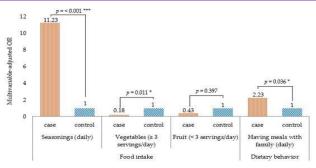

Figure 1: Dietary habits associated with type 2 diabetes mellitus in a case-control study of the urban residents in Yangon, Myanmar, 2019. Note: Multivariable logistic regression analysis; p-value for the comparison between two groups: \*\*\* p < 0.001, \* p < 0.05. All p-values are two-sided.

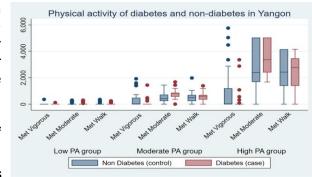

Figure2: Level of physical activity (PA) in METsmin.wk-I among diabetes patients and non-diabetes control group, within the category of low PA, moderate PA and active PA, Yangon Myanmar, 2019 (n=300). P<0.001, MANOVA.

# ボリビア国住民参加型ヘルスプロモーションに関する研究 Community-based Health Promotion Study in Bolivia

**[Background]** JICA Maternal and Child project assisted to implement community-based health promotion (HP) actions.

(Objective) The study aimed to evaluate the effect of HP intervention in Potosi and Oruro.

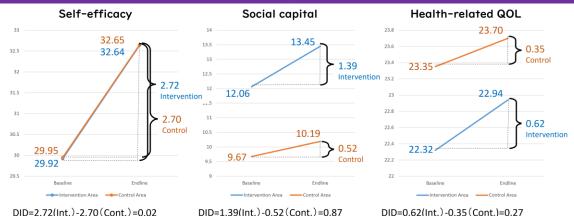

[Methods] Cluster randomized conducted. The verified questionnaire of selfefficacy, social capital, and health-related QOL. A difference in difference analysis performed.

(Findings) In Potosi, Social capital and QOL in Int. were significantly improved. In Oruro, Self-efficacy and Social capital in Int. were increased.

(Conclusion) HP intervention was effective in human & social capital of community residents.

# 2-(5) ボリビア国保健医療従事者のコンピテンシー調査および患者満足度調査 Survey of medical professional competency and patients' satisfaction in Bolivia

**Background** In JICA Maternal and Child Health Network Strengthening Project carried out in Oruro Department, Bolivia, a competency survey of health care workers was conducted to measure the effect of training for health care workers including doctors, nurses, and associate nurses.

**[Objective]** The "Competence Survey" measured the ability of health care workers to care for mothers and children.

[Methods] The study participants were doctors, nurses, and associate nurses engaged in medical centers in three intervention health divisions (intervention group) and three non-intervention divisions (control group) in Oruro Province. Surveys were conducted before and after the project using originally developed questionnaire based on UNICEF/WHO guideline.

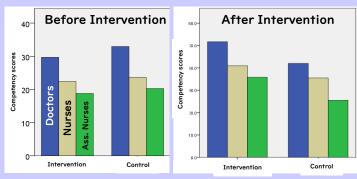

Fig 1. Competency survey

The number of doctors, nurses, and ass. Nurses were 97, 62 & 93 in int. and 41, 13, & 41 in con. before Int., and 118, 72 & 105 in int. and 44, 12 & 57 in con. After Int. The intervention had been provided for three years.

**(Findings)** The mean of competence scores of the intervention grope was significantly improved in doctors, nurses and ass. nurses in intervention group that those of control group for three years.

**Background** The JICA Oruro project aimed to improve patient's satisfaction at health centers as one of the outcome of the project.

**[Objective]** The project measure the patient's satisfaction which was provided at the intervention health centers.

[Methods] The questionnaire of HCAHPS (Hospital consumer assessment of healthcare providers and system) was used to measure the satisfaction. The number of patients were 228 (M; 55, F; 173) in int. and 247 (M; 63, F; 184) in con before Int., and 138 (M; 48, F; 90) in int. and 146 (M; 53, F; 93) in con. After Int.

**(Findings)** The mean of patient's satisfaction score of the intervention grope was significantly improved to doctors and nureses in intervention group that those of control group for three years.

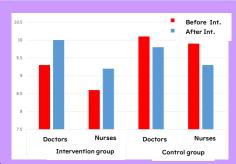

Fig 2. Satisfaction survey

#### タイ王国ランパーンにおける禁煙行動に関する介入研究 2-(6) RCT study on smoking cessation in Lampang, Thailand (ESCAPE study)

[Objective] Smoking cessation is an achievable behavioral change, which reduces the risks of cardiovascular diseases, cancers and tobacco-related diseases. There is a need for an effective smoking cessation service for low and middle income country settings where the smoking rate is generally very high whilst a cessation service is not usually accessible. This study devised a new smoking cessation service package and assessed its effectiveness in the primary health care setting of northern Thailand.

[Methods] Randomized controlled trial A total of 319 eligible patients who consented to participate in the study, were randomly allocated to an intervention arm (160) and a control arm (159), applying block randomization. The multicomponent intervention service consisted of: (1) regular patient motivation by the same nurse over a 3-month period; (2) a monthly piCO+ Smokerlyzer test for 3 months; (3) continual assistance from a trained family member, using a smokingcessation-diary; and (4) optional nicotine replacement chewing gum therapy. The control group received the routine service comprising of brief counseling and casual follow-up. Smoking cessation, confirmed by six months of abstinence and the piCo+ Smokerlyzer breath test, was compared between the two services after a year follow-up. The trial is registered as an international current control trial at the ISRCTN registry. ISRCTN89315117.

(Findings) The intervention arm participants achieved a significantly higher smoking cessation rate than the control arm 25.62% vs 11.32%, with an adjusted odd ratio of 2.95 and 95% confidence interval 1.55-5.61.

[Conclusion] Utilizing community resources as major intervention components, the evidence from this trial may provide a useful and scalable smoking cessation intervention for low and middle income countries.

## タイ王国チェンライにおける減塩行動に関する介入研究 RCT study on salt reduction in Chiangrai, Thailand

**Background** Global sodium intake remains above the recommended levels to control blood pressure (BP).

**(Objectives)** We aimed to evaluate the efficacy of a dietary intervention on BP through salt reduction among community-dwelling participants with high risk of cardiovascular disorders.

[Method] This cluster randomized trial (February 2012 to January 2013) included cooking instruction using the pocket salt meter among patients with diabetes and/or hypertension who were treated at health center in Thailand. Based on health centers, 8 clusters of eligible participants were randomly allocated to the 4 intervention and 4 control groups. Dietary intervention was performed at baseline, I month, and 3 months in intervention group. In both groups, systolic and diastolic BPs, and estimated 24 hours salt intake based on overnight urine samples were measured at baseline, 6 months, and 12 months.

**(Findings)** There were significant difference in systolic BP and estimated salt intake after adjusting covariates at 6 months. However, these differences were not observed at 12 months. There were no differences in diastolic BP in both followups.

**(Findings)** The results suggest the effectiveness of a visually based dietary intervention targeting salt intake reduction in short term, but the effectiveness discontinued in long term.

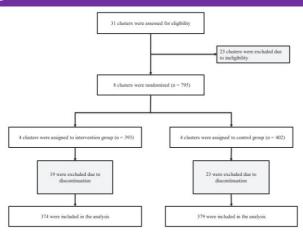

Figure I: Flow chart for enrollment and follow up

#### 日本の小学生5・6年生に対する禁煙予防教育教材の効果研究 2-(8)Educational effectiveness on no-smoking for primary school children in Japan

**Background** Hokkgido is the prefecture with the highest adult smoking rate in Japan. Raising public awareness through cancer education from a younger age is a key to prevent and control cancer and other NCDs. Two health educational DVDs were developed by Hokkaido-Sapporo Cancer Seminar Foundation.

**Objective** The study aims to evaluate the effects of the antismoking education using these DVDs at randomly selected schools in four geographically various prefectures.

#### [Methods] We measured....

- 1) The change in children's image of tobacco smoking, before and after the education, using the Kano Test for Social Nicotine Dependence (KTSND).
- 2) One month after the class, what kind of interactions actually occurred among children, parents, and adults in their community

(Findings) The survey elucidated the high smoking rate (62.9%) among adults surrounding the children. This explains the result that the 299 (13.2%) showed higher tolerance to smoking.

[Conclusion] Our DVDs encouraged young children to talk to their own parents and adults in the community. Many of them did actually talk and they perceived some changes in their parents and other adults. We continue to promote cancer education from younger age.

#### Two DVDs were designed to.....

"What is cancer? Why do people get cancer?"

2. "Goodbye to smoking, *Tsuru-kame* Dining Restaurant." (8 minutes and 30 seconds)

"I can't tell Dad to quit smoking" "Clear discarded cigarette butts" "Non-smoking restaurant now!"

- 2,263 six graders at 31 schools received the education in 2015.
- 1,424 (62.9%) reported that their parent, grandparent, and/or close community member smokes. Father(985), mother(407), grandfather(406),

Score >= 10	Miyagi	Nagano	Okayama	Kumamoto	Total
Before	86	56	91	66	299
Deloie	(14.3%)	(15.1%)	(14.6%)	(10.5%)	(13.2%)
After	56	29	43	36	164*
Aiter	(9.3%)	(7.8%)	(6.9%)	(5.8%)	(7.2 %)

- Their mean KTSND score improved from  $4.85 \pm 4.11$  to  $3.58 \pm 3.57$ .
- The number of students with smoking accepting tendency also went down from 299 to 164.

Yuasa M, Sirayama Y, Kigawa M, Chaturanga I, Mizoue T, Kobayashi H.: A health promoting school (HPS) program among primary and secondary school children in Southern Province, Sri Lanka: A qualitative study on the program's effects on the school children, parents, and teachers. Journal of International Health 30, 93-101, 2015

# JICA保健関連プロジェクトの分析研究 Analysis of JICA health-related projects

**(Background)** The Japan International Cooperation Agency (JICA) has focused its attention on appraising health development assistance projects and redirecting efforts towards health system strengthening.

**(Objective)** The study aimed to describe the type of project and targets of interest, and assess the contribution of JICA health-related projects to strengthening health systems worldwide.

[Methods] We collected a web-based Project Design Matrix (PDM) of 105 JICA projects implemented between January 2005 and December 2009. We developed an analytical matrix based on the World Health Organization (WHO) health system framework to examine the PDM data and thereby assess the projects' contributions to health system strengthening.

**(Findings)** The majority of JICA projects had prioritized workforce development, and improvements in governance and service delivery. Conversely, there was little assistance for finance or medical product development.

**Conclusion** Our study confirmed that JICA projects met the goals of bilateral cooperation by developing workforce capacity and governance. We also showed that the analytical matrix methodology is an effective means of examining the component of health system strengthening to which the activity and output of a project contributes.

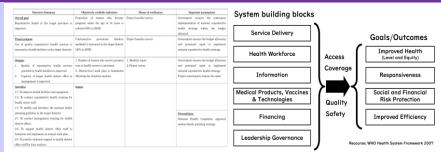

Fig I. An example of PDM

### 戦後日本の健康に関する都道府県別パネルデータ分析 Panel data analysis on health by province in post-war Japan

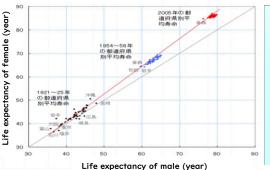

**(Background)** Recently, Japanese life expectancy has been the longest in the world. 70% of the life expectancy extension from 1921 to 2010 (male 35.66, female 41.40) was achieved before the establishment of the universal health insurance system in 1961. Infant mortality decline was most contributed to the life expectancy extension (30-40%).

**(Objective)** The study aims to identify determinants that improved life expectancy of Japanese from 1961 to 2009.

**(Methods)** A panel data analysis is performed with multiple regression analysis and structural equation modeling method.

Table. Panel data related to health by province in 1961-2009

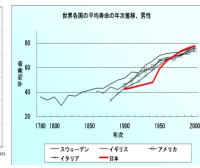

Fig 1. Life expectancy of Japanese male and female in 1921-25, 1954-56, 2005

Discrepancy among provinces had been

decreased, but gap between male and female

had been increased.

Fig 2. Male life expectancy in developed countries

After WW2, life expectancy of Japan had dramatically

improved.

1961~1973 1973~1990 Removal of information bias Panel data related to health by province Control of confounder by Univariable analysis by coefficient Removal of random erro Correlation analysis + Cluster analysis Control of Multicollinearity r>0.85 Multivariable regression analysis Control of confounder Identify determinant to affect life expectancy ··Study objective (1) Create path diagram with significant determinant Control of ecological fallacy Structural equation modeling (SEM) Removal of identification Model evaluation by goodness-of-fit index Factors that determine life expectancy are elucidated ··Study objective (2)

Fig 3. Analysis procedure to elucidate factors affecting life expectancy of Japanese people from 1961 to 2009

#### 東洋的ストレス対処の受容的感覚に関する指標開発研究 2-(11)

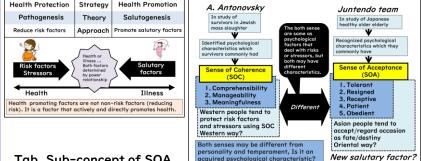

Development of indicator on Sense of Acceptance (SOA) for stress-coping

**Background** The oriental view of the world and life is vaguely recognized by subject and object, and has a strong tendency to be introverted, sensory, and subconscious.

(Objective) The study aimed to identify oriental stress coping sensations based on the above characteristics.

[Methods] The first edition of the questionnaire was created by the facet method for the results of interviews with local government officials and tsunami victims. Next, using this questionnaire, the first survey was conducted on 358 local government employees, and the results were promax-rotated by factor analysis to extract the subconcept. In addition, the second survey was conducted for 280 general residents and corporate employees, and the results were promax-rotated by factor analysis to extract the final sub-concept.

(Findings) When the questions were asked by the facet method, a total of 26 questions were created, including 6 questions of counteradherence, disidentification, and inclusiveness, and 8 embracement. As a result of the second survey, the number of questions with a factor loading of 0.6 or more was 3 questions of counter-adherence (Cronbach  $\alpha = 0.708$ ), 2 questions of disidentification ( $\alpha = 0.718$ ), and 2 questions of inclusiveness ( $\alpha$ =0.650), and 3 questions of embracement ( $\alpha$ =0.763). The Pearson correlation coefficient between SOA and WCCL positive cognition and social support was

Tab. Sub-concept of SOA

rub. Sub concept of SOA											
Sub-concept	definition	Example expression									
脱執着感 Counter-adherence	Sense free from stress (not overreacting)	<ol> <li>くよくよ考えない</li> <li>水に流す</li> <li>気分転換する</li> </ol>									
脱同一化感 Disidentification	Sense of actively and objectively observing being in a stressed state	1. 自分の気持ちと距離を置いてみる 2. こんなものだ									
包容感 Tolerance Inclusiveness	Sense of accepting being stressed as a reason for things	<ol> <li>仕方ない</li> <li>諦めるしかない</li> <li>だめなら、だめでいい</li> <li>やるだけのことはやった</li> <li>何とかなる</li> </ol>									
被包容感 Embracement Being included	Sense of being accepted by an existence	<ol> <li>ひとりじゃない</li> <li>ありがたい</li> <li>お陰さまです</li> <li>大きな存在に支えられている</li> </ol>									

0.524 (p<0.001). The correlation coefficient between SOA and SOC (Univ. of Tokyo ver. 3 questions) was 0.586 (p<0.001).

[Conclusion] The 10 items in the SOA questionnaire were considered to be useful indicators as a measure of emotional stress coping.
